- Reading Deficits
- Residual Disabilities Related to Infection and Trauma
- Sensory Integration Disorder
- Speech Language Deficits
- Spina Bifida
- Stuttering and Articulation Deficits
- Swallowing or Feeding Difficulties
- Visual Deficits

Purpose

The purpose of pediatric therapy services is to help the child achieve normal development, healthy self concept, cognitive skills, and emotional maturation. Therapy promotes age-appropriate skills with self care, mobility, social adjustment, gross/fine motor skills, and communication.

Team Approach

Our program consists of evaluations, consultations, and treatment in a multidisciplinary setting. All of our pediatric therapists hold a bachelors and/or master's degrees from accredited universities and are experienced in the Interactive Metronome (IM) System. IM is a treatment tool to improve the neurological functions of motor planning and sequencing, as well as improving these areas: attention and concentration, auditory processing, cognitive processing, motor control, coordination, reading and math fluency, language processing, executive functions, and control of aggression/impulsivity. Our speech therapists are certified in pediatric video swallow studies as well. **Our goal is to help children reach their potential for development, strength, communication, and movement through therapy services.**
